Exploring Git Collaboration

Aziz Zai

24.04.2024

IT'S YOUR TURN!!!

1. How can you use Git as a collaboration platform?

- **Version Control**: We use Git in our product's frontend as a version control system to manage changes to our code. Also for documentation
- **Branching**: We work on different branches, each specific to a feature, bug fix, or refactoring action, which helps isolate changes and manage development flow.
- **Pull Request**: Merging the branches to the main branch needs a Pull Request.
- **Review**: A Pull Request is always beeing reviewd by atleast 2 people.
- **Remote Repositories**: We use GitHub for hosting our remote repositories, enabling centralized access and collaboration.
- **Hooks**: We utilize Git commit and push hooks to perform checks before committing and pushing code, ensuring code quality and consistency.

2. What online platforms host Git?

- Yes for example:
  - GitHub
  - GitLab
  - Bitbucket
  - Azure Repos
  - AWS CodeCommit

3. Are there differences between online platforms?

- **Yes, they have different features**:
  - Github has Github Actions for example. Which is pretty cool!

4. Add your findings to your script and commit the changes.

DONE
